

REMOTE ROCKBREAKER MONITORING

FIRST ON THE MARKET

Rammer, the leading supplier of rockbreaker technology is the first on the market to add remote monitoring system for hydraulic rockbreakers.

The RD3 monitoring device is attached to the rockbreaker pinpointing the exact location of the equipment and reporting back to the customer detailed information about the rock breaking operation in real time via cloud based My Fleet platform.

By using advanced electronics to sense the impacts and stresses on the rockbreaker, RD3 provides information on how the rockbreaker is being operated. One of the major causes of premature failure in rockbreakers is long cycles where the operator continues to hit the button and the piston keeps striking for an extended period of time. With RD3, customers can remotely monitor rockbreaker usage and provide operator education when needed to avoid maintenance costs due to premature failure. Correct operation minimizes the chance that rockbreaker fails and causes costly unscheduled downtime.

Simply by logging into the MyFleet platform, customers can see all the data on operating hours and required service intervals helping them manage service periods and minimize machinery downtime by scheduling maintenance during times of least impact on production. With downtime planned at optimal times based on the data of rockbreaker usage, maintenance programs can be streamlined to improve efficiency and reduce costs.

The hour meter shows MyFleet users the total time the rockbreaker has been engaged in rockbreaking that can ensure a higher re-sale value as the actual work hours are known.

RD3 remote monitoring is an important addition to Rammer rockbreaker offering to address the needs of customers who are looking at the cost, performance and efficiency of their operations.

The cutting-edge technology is available in all new Rammer Excellence line of rockbreakers as standard.
